## Benefits

- Evaluate, test and apply Windows OS patches
- Automate software and driver patch application
- Ensure corporate device security and performance
- Minimize manual, on-premise IT efforts

## Introduction

As cyber security threats evolve, the attackers look for smarter ways to crack into systems that can prove fatal to the security posture of your organization. Staying on top of your device inventory with the latest versions of operating systems has no bypass. With remote working, the Windows workstations that your workforce accesses are more susceptible to cyber attacks.

A solution to assess the current OS versions on the entire device inventory, rectifying both known and unknown vulnerabilities attacking the systems with appropriate OS patches is critical. More so, for a distributed team this is costly, which is why over-the-air deployment is not only important to ensure efficient IT optimization but is also cost-effective.

This datasheet explores Scalefusion Patch Management for Windows OS, which can not only help optimize IT efforts and costs involved in patching software and driver updates but also can warrant device performance improvements, data security and operational excellence of the said Windows workstations.

## Introduction to Patch Management

Patch management is a group of systems or policies that together help in identifying, obtaining, evaluating and pushing patches or updates to fix software and/or driver bugs, eliminate security loopholes or launch new features. Patch management can be driven at the OS level (for OS updates). Moreover, Patch Management doesn't simply involve pushing patches or installing the updates but also includes ensuring that patches are delivered and installed properly, their status report is obtained and the devices (that were patched) are running smoothly.

The responsibility of patch management lies with the IT teams of the organization. This is why, Scalefusion Patch Management works seamlessly with Windows device management, right within the dashboard.

Scalefusion Windows Agent-based Update & Patch Management feature is an automated patch management solution to keep all the managed Windows devices up-to-date with Windows OS updates thus keeping them secure. This includes scanning, assessment, deployment, monitoring and reporting of all the available OS patches for Windows devices managed using Scalefusion.

# Scalefusion for Windows Patch Management: Key Benefits

With Scalefusion Patch Management Software for Windows, enterprises deploying Windows desktops and laptops can:

## Latest updates

Automated Software and Driver update application at the Device level or Device group level

## Optimized IT Efforts

All the Windows endpoints can be automatically patched reducing the cognitive IT load

## Enhanced Security

OS Patches that can assess, identify and remediate vulnerabilities are quickly identified and applied

## Improved Visibility

IT teams can track the status of the patches, download reports for the updates that are available/installed

## Force Reboot

Once the updates are patched, IT teams can force reboot the devices and get them up and running quickly to not interfere with the business operations

## Save costs

Enterprises do not need to invest in a third-party patching server to achieve patch management for Windows

What makes Scalefusion Patch Management attractive is that it is not just a standalone patch management tool but it seamlessly integrates with the MDM platform, making it easy to access, with no new tool to acquire and learn for the IT teams and adds to the overall monitoring capabilities extended by Scalefusion.
